

Bonjour

First of all, thanks for letting me to solve this solution.

For run this project please first see DB folder for creating database, then run the API folder, after all you can visit angular folder for see the front-end side.

For angular side: inside folder run these commands:

1. `npm i` ➔ to install node-modules (git not allowed to upload it)
2. `npm start` ➔ to run and check this url: <http://localhost:4200/>

Description of project:

I've created an API core and use Repository design pattern and also this project has an Aircraft entity with CRUD actions as you want. Moreover, tried to use Clean Code, SOLID, IoC and Dependency injection to design it. Angular version is 11.

Best Regards

Kiyanaz
